Software Engineering Intern: Oculus Application Platform Team

Menlo Park, CA
June 2019 - Present

- **Swift Playgrounds on Windows:** Implemented Swift Playgrounds on Windows, using GDI32 for UI, Apple's Swift compiler for frontend, and LLVM's ORC to JIT and execute the code. Involved modifications at both the AST level and the IR level, and submitting patches to both the compiler and LLVM. Source Code at github.com/save-buffer/swift-repl

Bespoke Silicon Group

Undergraduate Researcher

Seattle, WA
March 2019 - Present

- **Hammerblade Manycore:** Created APIs for and tested a RISC-V Manycore CPU. Further, created highly optimized kernels for machine learning on the Manycore.

MemSQL

Software Engineering Intern: Query Execution

Seattle, WA
June 2018 - September 2018

- **SIMD for Query Execution:** Worked on MemSQL columnstore: Implemented low-level optimizations for summation in query execution engine with AVX2. Achieved up to 20x speedup of internal components, resulting in up to 1.8x speedup of total query execution time of customer workloads.

Husky Robotics

Software Team Lead

Seattle, WA
June 2018 - October 2019

- **Husky Robotics Software Team:** The team works to create a Mars Rover to compete in the University and Canadian Rover Challenges. Wrote code ranging from sensor interfaces to networking to inverse kinematics to computer vision, and guided others in helping implement these things. Was a member of the team for one year prior to election as team leader. The team won 2nd place at the 2019 Canadian Rover Challenge.

MemSQL

Software Engineering Intern

Seattle, WA
August 2017 - September 2017

- **Hash Join Optimization:** Worked on MemSQL in-memory distributed DBMS, optimizing Hash Join when joining on Integer Keys. Achieved 2x speedup on Hash Join
- **Graphical Explain Plan:** Created graphical explain plan visualizer for viewing a breakdown of queries.

Microsoft

High School Intern

Redmond, WA
June 2016 - August 2016

- **Cyberattack Analytics Dashboard:** Developed a Web Application which visualized statistics on cyberattacks. On display in the CDOC (Cyber-Defense Operations Center)
- **HoloFlight:** Participated in the OneWeek hackathon, where I worked on HoloFlight, an application for the HoloLens that directs a drone to fly to waypoints selected on a holographic map. Won 2nd place in the HoloHack division.

University of Washington

BS Computer Science with Honors
BS Discrete Mathematics

Overall GPA: 3.69
In-Major GPA: 3.79
In-Major GPA: 3.63

Seattle, WA
June 2020
June 2020

Coursework

- **Algorithms:** Proof-based class focusing on using existing techniques to create and prove new algorithms.
- **Digital Circuit Design:** Project-based class focusing on introducing the basics of Verilog and FPGAs. Created a clone of Dance Dance Revolution on an FPGA using an LED matrix and four pushbuttons.
- **Deep Learning on Coursera:** Introductory online machine learning course taught by Andrew Ng. Homework done in Python, with a combination of hand-written and premade machine learning software.
- **Embedded Systems:** Project-based class focusing on the creation of an embedded operating system. Created a medical device using Arduino running a custom scheduler and task queue system.
- **Stanford Compilers on Coursera:** Introductory online compilers course taught by Prof. Alex Aiken. Implemented a compiler for COOL (Classroom Object-Oriented Language) targeting MIPS.
- **3D Graphics at DigiPen Institute of Technology:** Summer class introducing 3D Graphics, first algebraically and then using linear algebra. Implemented a 3D Graphics pipeline from scratch in C (starting only with a SetPixel function) which draws colorful cubes, and allows the user to rotate the camera.

Accomplishments

- **2017 ACM ICPC Regionals Qualifier:** Won 6th place at the UW ACM ICPC competition on team MATLAB Indexers, qualifying for regionals.
- **Hunt the Wumpus Alumni Challenge 2016 Winner:** Programmed a game in C# from scratch and was selected by a panel of judges as the winner for having the most polished and most entertaining game. Available at github.com/save-buffer/ShooterGame

Projects

- **Robotics Algorithms:** Computer vision and inverse kinematics algorithms written for use by the Husky Robotics team. Computer vision can locate tennis balls in an image and segment a keyboard into keys. The inverse kinematics algorithm was created by myself and another member of the team and implemented by me. Available at github.com/save-buffer/robot_cv, github.com/save-buffer/UseArm
- **Slang:** Compiler for a low-level functional declarative language (like Erlang) written in C. Available at github.com/save-buffer/slang
- **SashCopter:** An attempt at controlling a drone using an EEG Headset. Main drone control software is written. Mind-controlled aspect deemed unsuccessful due to the lack of resolution on the headset. github.com/save-buffer/SashCopter
